Skopin FileCopier

Skopin FileCopier is a software which allows you to copy files of any type from broken media (damaged CD/DVD disks, flash, floppy, hard disks). You can also use it to copy files through the local network area with an unstable connection. It is extremely compact – 72 kilobytes. The program reads the file until it seeks on a bad sector. In case of any read error it asks you what to do the next: skip unreadable sectors and how many or read this sector from another copy of this file. Note, reading from scratched CD-ROMs will take some time because of specific driver functionality. If you copy a file with skipped sectors you will receive destination file with fragments filled with null bytes. In many cases, this is not a problem to play some kind of files, such as video (avi, jpeg, dat). In the case of documents (doc, txt) you can lose several paragraphs. Even if you copy the damaged zip-file, the probability of working capacity of a greater part of files containing in it is very great. However, the most important function is reading bad fragments from another copy of file - is has gained very much many people. Now it is possible, not caring about safety of documents, to write their two copies even on a bad diskette - the probability that Skopin FileCopier will restore 100 % an initial file is very great. Skopin FileCopier Features: Ability to skip bad sector. Ability to pause read operation and send the file source manually Ability to update the file source Ability to send files source via local area network. Recover (reconstruct) damaged files Ability to save copies of damaged files. Ability to save copies of damaged zip-files. Ability to save copies of damaged files. What's New in the Skopin FileCopier?

Suppose you have a damaged multimedia or just a CD-ROM disk and you are about to restore files. But, what to do with all those non-readable sectors. For some reason you failed to read them using a simple disc-reading tool. Thus, all your leisure is taken over by cdrdao, a cd-burning program with some specific features. Cdrdao cannot write to a media that has become unreadable, which is why you have to find another copy of that file on the same disk. One method is to search the entire disk using cddaoparanoia, an extended cd-burning tool, which is capable of finding any data that cddao can't access. Another option is to use cddb (a program that reads CD-DB), which is an archive program that reads the CD-DB files, which are collections of all the information on the disk. But the first method can be very time-consuming, even if it is meant to be used for large-scale operations. The other option is to use other applications that can read CD-DB files. This means either using another cd-burning program that reads CD-DB, or using a general program that can read the CD-DB files directly. However, cdrdao has an advantage here, that these operations don't involve writing. This means that you don't risk damaging the original CD-DB files, which is the case if you use cddb for example, because it writes CD-DB files. You can use cddb and cdrdao together to burn a single disk by copying the CD-DB files into one file using cddb, and then reading them with cdrdao. You can also use cddb to do a backup of a CD-DB collection and then restore it using cdrdao. You can also use cddb to restore single files from damaged CDs. But note, before you use cddb you must know that it does not try to search for all the files on the CD if the damaged part is too large. It only searches for files that are smaller than the maximum part size. You may decide to skip this step by entering the -s option when calling cddb. Therefore, the backup will restore only those files that were not too large. You can also use cddb to restore a single file that is damaged, unless
